ALOSCA Technologies

Dry Granular Range

- The only truly dry inoculant
- Available in 25 & 500 kg bags

What are the benefits of ALOSCA granular legume inoculants?

- The only truly dry granule, ALOSCA granules activate on the same seasonal triggers as the sown legume maintaining the viability of the Rhizobia bacteria until required by the plant at and after germination.
- ALOSCA Granules create superior levels of seeding flexibility through the ability to sow into dry or moist seed beds creating the opportunity to take advantage of warmer autumn conditions and due rainfall.
- Peat inoculants require moisture in the soil at seeding otherwise rapid mortality of the bacteria occurs (90% of the rhizobia per day) limiting the plants potential to nodulate.
- ALOSCA granules provide a buffer against seed dressings typically harmful to Rhizobium.
- Cereals are the main cash crop on most farms, therefore dry seeding the legume early in the season enables the grower to start seeding cereals on the opening rain.
- ALOSCA Granules are highly suited to early sowing (including summer sowing) of shallow sown pasture species to take advantage of early season rainfall and warmer soil temperatures.

How do I mix or incorporate ALOSCA Granules into my seeding process?

- Simplicity is the key to application. Over-mixing the product before transferring to the seeder should be avoided as may degrade or break up the granule which can lead to flow problems.
- Adequate mixing can be achieved by introducing the granules during the regular transfers of fertiliser or seed from the shed or silo to the grouper bin and then on to the seeder. If mixed with fertiliser ALOSCA granular inoculant should then be delivered via single shoot and not banded separately to the seed to ensure the rhizobia are in close proximity to the developing roots.
- With all granular seeding products, care should be taken to ensure seeding equipment calibrations are not affected by the nature of the product and should be double checked during initial seeding runs.

At what rate do I sow ALOSCA Granules?

- The standard sowing rate/application rate for ALOSCA granules is 10kg/ha. Because ALOSCA Granules are a truly dry formulation they can be mixed not only with seed but also with fertilizer or can be delivered from a stand-alone seed box.

Tine Row Spacing	Granules (kg/ha)
200 - 300mm (8 - 12 inch)	10
300 - 400mm (12 - 16 inch)	8
400 - 500mm (16 - 20 inch)	6
